COMPANY QUICK FACTS

Stellar Cyber—What We Do

The Stellar Cyber SecOps Platform enables you to maximize your security team productivity while elevating their ability to detect and defeat advanced attacks. The platform combines the capabilities you would expect from NG-SIEM, XDR, NDR, SOAR, Threat Intel, Malware Sandbox, and more in a single platform.

Stellar Cyber — How We Do It

Centralizing, normalizing, and enriching security data from all security tools, performing high-fidelity detection and incident correlation with ML, and automating response across an organization's entire attack surface. Open XDR can be flexibly deployed anywhere under a single license.

Why Customers Need the Stellar Cyber Open XDR Platform

Stellar Cyber greatly reduces cybersecurity risk by the early identification and remediation of attack activities, slashing costs, retaining investments in existing tools, and accelerating analyst productivity. The platform also provides effortless deployment of sensors to fill any gap on-premises or in the cloud.

Stellar Cyber Narrative

While the variety of cybersecurity solutions available to combat threats has exploded over the past decade, they all seem to have one commonality - *complexity*. Combine this with the inherent complexity of modern IT environments, and security decision-makers are challenged to keep their ever-evolving business secure. Stellar Cyber's goal is to deliver advanced security solutions that enable security teams of any size to experience enterprise-grade security.

Unlike other XDR products that rely heavily on endpoint detection and response solutions to identify threats, the Stellar Cyber Open XDR platform augments EDR alert data with native threat detection with built-in NDR, UEBA, IDS, Sandbox analysis, and TIP to deliver the critical security capabilities required to keep a business secure without complexity.

Unlike other Open XDR solutions that require standardization on the vendor's underlying security controls or have limited integrations to 3rd party products, the Stellar Cyber Open XDR platform is designed to work with any security stack. This open approach to data sourcing means you maintain control of your security strategy, free to change any security control as you see fit. The choice is yours, as it should be.

With flexible data source onboarding, purpose-built automated data normalization, context enrichment, built-in multi-modal AI-driven threat detection, intuitive threat hunting, real-time network traffic analysis, deterministic response capabilities, and the ability to work with your existing security stack, the Stellar Cyber Open XDR platform provides the world-class security you deserve that delivers value on day one.

A security team's size, skills, or experience shouldn't mean an organization must accept inferior security. With Stellar Cyber, everyone can keep their environment
